

Project Gamblitz installation guide

Installation:

Make sure you backup your savefile before installing this mod.

(Use Checkpoint or JKSV)

First, make sure you have installed Atmosphere in your Nintendo Switch by following [this guide](#), it's highly recommended to create an **emuNAND**. This guide also applies to ¹*Ryujinx.

At the moment of writing this (14/03/2022), **the only way** you can download the mod is joining the [Discord server](#) and join the **Closed Beta** currently going on. To join the beta, you either have to win a giveaway when we're hosting one, or get direct access by boosting the server.

Once you've got your "**Closed Beta**" role, head over to the **#download** channel and download the .zip file with the ID of your game region. (EUR, JP and US).

Once downloaded, extract the atmosphere folder to the root of your SD card, if it asks you to replace any file, replace it.

¹* Instead of extracting the atmosphere folder, double click it and extract the contents folder and exefs_patches folder into your Ryujinx mods folder (click File> Open Ryujinx Folder, navigate into mods folder).

To check if you installed correctly the mod, the “Credits” screen should show up:

If it doesn't show up, please check if you installed the mod correctly or if you downloaded the correct .zip file.

Uninstalling:

To uninstall the mod, inside “exefs_patches”, remove:

“Gamblitz patches” and the folder with the ID of your game region.

Inside “contents>(the ID of your game region)”, remove both exefs and romfs folders.

You can ask for support in the #support channel by joining the [Discord server](#) if you need to.
